

2.7Gbps, Low-Power SFP Laser Drivers

ABSOLUTE MAXIMUM RATINGS

Supply Voltage, V_{CC}	-0.5V to +6.0V	Continuous Power Dissipation ($T_A = +85^\circ\text{C}$)	
Current into BIAS, OUT+, OUT-	-20mA to +150mA	24-Lead Thin QFN (derate 20.8mW/ $^\circ\text{C}$)	
Current into MD.....	-5mA to +5mA	above +85 $^\circ\text{C}$	1354mW
Voltage at IN+, IN-, TX_DISABLE, TX_FAULT, SHUTDOWN	-0.5V to ($V_{CC} + 0.5\text{V}$)	24-Lead QFN (derate 20.8mW/ $^\circ\text{C}$)	
Voltage at IN+, IN-, TX_DISABLE, TX_FAULT, SHUTDOWN	-0.5V to ($V_{CC} + 0.5\text{V}$)	above +85 $^\circ\text{C}$	1354mW
Voltage at BIAS, PC_MON, BC_MON, MODSET, APCSET	-0.5V to ($V_{CC} + 0.5\text{V}$)	Operating Ambient Temperature Range (T_A).....	-40 $^\circ\text{C}$ to +85 $^\circ\text{C}$
Voltage at OUT+, OUT-.....	+0.5V to ($V_{CC} + 1.5\text{V}$)	Storage Ambient Temperature Range.....	-55 $^\circ\text{C}$ to +150 $^\circ\text{C}$
Voltage at APCFLT1, APCFLT2.....	-0.5V to +3V	Die Attach Temperature.....	+400 $^\circ\text{C}$
		Lead Temperature (soldering, 10s).....	+300 $^\circ\text{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

($V_{CC} = +2.97\text{V}$ to +3.63V, $T_A = -40^\circ\text{C}$ to +85 $^\circ\text{C}$. Typical values at $V_{CC} = +3.3\text{V}$, $I_{BIAS} = 20\text{mA}$, $I_{MOD} = 30\text{mA}$, $T_A = +25^\circ\text{C}$, unless otherwise noted.) (Note 1)

SAFETY FEATURES						
Excessive Bias-Current Comparator Threshold Range		TX_FAULT always occurs for $V_{BC_MON} \geq 1.38V$, TX_FAULT never occurs for $V_{BC_MON} \leq 1.22V$	1.22	1.30	1.39	V
Excessive MD-Current Comparator Threshold Range		TX_FAULT always occurs for $V_{PC_MON} \geq 1.38V$, TX_FAULT never occurs for $V_{PC_MON} \leq 1.22V$	1.22	1.30	1.39	V
SFP TIMING REQUIREMENTS						
TX_DISABLE Assert Time	t_off	Time from rising edge of TX_DISABLE to $I_{BIAS} = I_{BIASOFF}$ and $I_{MOD} = I_{MODOFF}$ (Note 4)		0.14	5	μs
TX_DISABLE Negate Time	t_on	Time from falling edge of TX_DISABLE to I_{BIAS} and I_{MOD} at 95% of steady state when TX_FAULT = 0 before reset	C _{APC} = 2.7nF, MAX3735 (Note 4)		1	ms
			MAX3735A (Note 11)		600	μs
TX_DISABLE Negate Time During FAULT Recovery	t_onFAULT	Time from falling edge of TX_DISABLE to I_{BIAS} and I_{MOD} at 95% of steady state when TX_FAULT = 1 before reset (Note 4)		60	200	ms
TX_FAULT Reset Time or Power-On Time	t_init	From power-on or negation of TX_FAULT using TX_DISABLE (Note 4)		60	200	ms
TX_FAULT Assert Time	t_fault	Time from fault to TX_FAULT on, C _{FAULT} \leq 20pF, R _{FAULT} = 4.7k Ω (Note 4)		3.3	50	μs
TX_DISABLE to Reset		Time TX_DISABLE must be held high to reset TX_FAULT (Note 4)			5	μs

Note 1: Specifications at $-40^{\circ}C$ are guaranteed by design and characterization. Dice are tested at $T_A = +25^{\circ}C$ only.

Note 2: Maximum value is specified at $I_{MOD} = 60mA$, $I_{BIAS} = 100mA$.

Note 3: TX_FAULT is an open-collector output and must be pulled up with a 4.7k Ω to 10k Ω resistor.

Note 4: Guaranteed by design and characterization.

Note 5: V_{CC} turn-on time must be $\leq 0.8s$, DC-coupled interface.

Note 6: Gain stability is defined by the digital diagnostic document (SFF-8472, rev. 9.0) over temperature and supply variation.

Note 7: Assuming that the laser diode to photodiode transfer function does not change with temperature.

Note 8: Accuracy refers to part-to-part variation.

Note 9: Deterministic jitter is measured using a 223 - 1 PRBS or equivalent pattern.

Note 10: Broadband noise is filtered through the network as shown in Figure 3. One capacitor, $C < 0.47\mu F$, and one 0603 ferrite bead or inductor can be added (optional). This supply voltage filtering reduces the hot-plugging inrush current. The supply noise must be $< 100mV_{P-P}$ up to 2MHz.

Note 11: C_{APC} values chosen as shown in Table 4 (MAX3735A).

MAX3735/MAX3735A

Pin Description

PIN	NAME	FUNCTION
1, 4, 8, 14, 18	VCC	+3.3V Supply Voltage
2	IN+	Noninverted Data Input
3	IN-	Inverted Data Input
5	PC_MON	Photodiode Current Monitor Output. Current out of this pin develops a ground-referenced voltage across an external resistor that is proportional to the monitor diode current.
6	BC_MON	Bias Current Monitor Output. Current out of this pin develops a ground-referenced voltage across an external resistor that is proportional to the bias current.
7, 12, 22	GND	Ground
9	SHUTDOWN	Shutdown Driver Output. Voltage output to control an external transistor for optional shutdown circuitry.
10	TX_FAULT	Open-Collector Transmit Fault Indicator (Table 1).
11	MODSET	A resistor connected from this pad to ground sets the desired modulation current.
13	BIAS	Laser Bias Current Output
15, 16	OUT+	Noninverted Modulation Current Output. Connect pins 15 and 16 externally to minimize parasitic inductance of the package. I _{MOD} flows into this pin when input data is high.
17	OUT-	Inverted Modulation Current Output. I _{MOD} flows into this pin when input data is low.
19	MD	Monitor Diode Input. Connect this pin to the anode of a monitor photodiode. A capacitor to ground is required to filter the high-speed AC monitor photocurrent.
20	APCFILT1	Connect a capacitor (C _{APC}) between pin 20 (APCFILT1) and pin 21 (APCFILT2) to set the dominant pole of the APC feedback loop.
21	APCFILT2	See APCFILT1
23	APCSET	A resistor connected from this pin to ground sets the desired average optical power.
24	TX_DISABLE	Transmitter Disable, TTL. Laser output is disabled when TX_DISABLE is asserted high or left unconnected. The laser output is enabled when this pin is asserted low.
EP	Exposed Pad	Ground. Must be soldered to the circuit board ground for proper thermal and electrical performance (see the <i>Exposed Pad Package</i> section).

Detailed Description

The MAX3735/MAX3735A laser drivers consist of three parts: a high-speed modulation driver, a laser-biasing block with automatic power control (APC), and safety circuitry (Figure 4). The circuit design is optimized for high-speed and low-voltage (+3.3V) operation.

High-Speed Modulation Driver

The output stage are composed of a high-speed differential pair and a programmable modulation current source. The MAX3735/MAX3735A are optimized for driving a 15Ω load; the minimum instantaneous voltage required at OUT+ is 0.6V. Modulation current swings up to 60mA are possible when the laser diode is DC-coupled to the driver and up to 85mA when the laser diode is AC-coupled to the driver.

To interface with the laser diode, a damping resistor (R_D) is required for impedance matching. The combined resistance of the series damping resistor and the equivalent series resistance of the laser diode should equal 15Ω. To reduce optical output aberrations and duty-cycle distortion caused by laser diode parasitic inductance, an RC shunt network might be necessary. Refer to Maxim Application Note HFAN 02.0: *Interfacing Maxim's Laser Drivers to Laser Diodes* for more information.

At data rates of 2.7Gbps, any capacitive load at the cathode of a laser diode degrades optical output performance. Because the BIAS output is directly connected to the laser cathode, minimize the parasitic capacitance associated with the pin by using an inductor to isolate the BIAS pin parasitics from the laser cathode.

2.7Gbps, Low-Power SFP Laser Drivers

MAX3735/MAX3735A

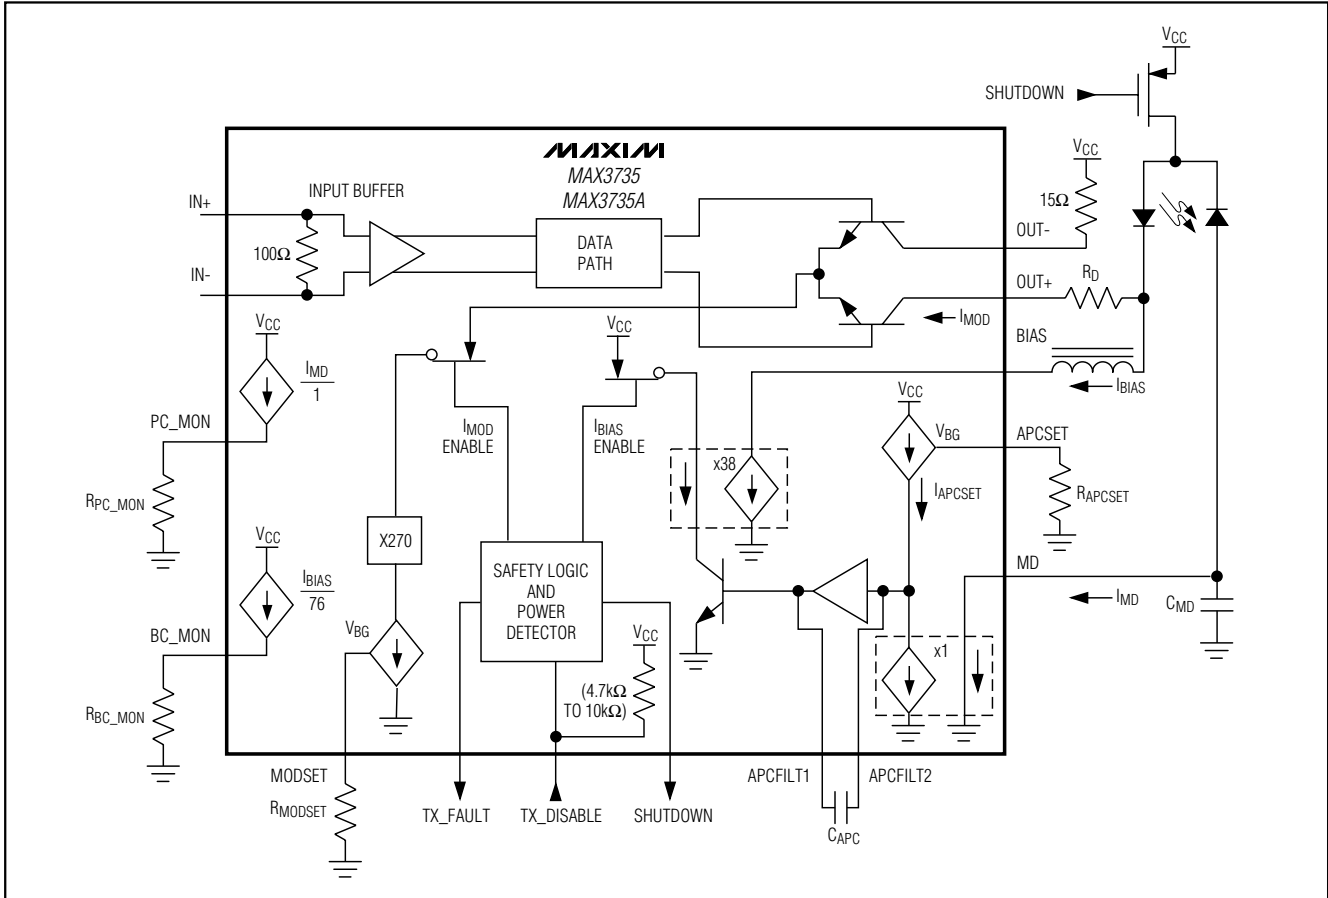

Figure 4. Functional Diagram

Laser-Biasing and APC

To maintain constant average optical power, the MAX3735/MAX3735A incorporate an APC loop to compensate for the changes in laser threshold current over temperature and lifetime. A back-facet photodiode mounted in the laser package is used to convert the optical power into a photocurrent. The APC loop adjusts the laser bias current so that the monitor current is matched to a reference current set by R_{APCSET} . The time constant of the APC loop is determined by an external capacitor (C_{APC}). For possible C_{APC} values, see the *Applications Information* section.

Safety Circuitry

The safety circuitry contains an input disable ($TX_DISABLE$), a latched fault output (TX_FAULT), and fault detectors (Figure 5). This circuitry monitors the operation of the laser driver and forces a shutdown if a fault is detected (Table 1). A single-point fault can be a short to V_{CC} or GND . See Table 2 to view the circuit

response to various single-point failures. The transmit fault condition is latched until reset by a toggle of $TX_DISABLE$ or V_{CC} . The laser driver offers redundant laser diode shutdown through the optional shutdown circuitry (see the *Typical Applications Circuit*). The TX_FAULT pin should be pulled high with a $4.7k\Omega$ to $10k\Omega$ resistor to V_{CC} as required by the SFP MSA.

Safety Circuitry Current Monitors

The MAX3735/MAX3735A feature monitors (BC_MON , PC_MON) for bias current (I_{BIAS}) and photo current (I_{MD}). The monitors are realized by mirroring a fraction of the currents and developing voltages across external resistors connected to ground. Voltages greater than 1.38V at PC_MON or BC_MON result in a fault state. For example, connecting a 100Ω resistor to ground on each monitor output gives the following relationships:

$$V_{BC_MON} = (I_{BIAS} / 76) \times 100\Omega$$

$$V_{PC_MON} = I_{MD} \times 100\Omega$$

2.7Gbps, Low-Power SFP Laser Drivers

Figure 5. Safety Circuitry

Table 1. Typical Fault Conditions

1.	If any of the I/O pins is shorted to GND or V _{CC} (single-point failure, see Table 2), and the bias current or the photocurrent exceed the programmed threshold.
2.	End-of-life (EOL) condition of the laser diode. The bias current and/or the photocurrent exceed the programmed threshold.
3.	Laser cathode is grounded and the photocurrent exceeds the programmed thresholds.
4.	No feedback for the APC loop (broken interconnection, defective monitor photodiode), and the bias current exceeds the programmed threshold.

Design Procedure

When designing a laser transmitter, the optical output usually is expressed in terms of average power and extinction ratio. Table 3 shows relationships helpful in converting between the optical average power and the modulation current. These relationships are valid if the mark density and duty cycle of the optical waveform are 50%.

Programming the Modulation Current

For a given laser power (P_{AVG}), slope efficiency (η), and extinction ratio (r_e), the modulation current can be calculated using Table 3. See the Modulation Current vs. R_{MODSET} graph in the *Typical Operating Characteristics*

section, and select the value of R_{MODSET} that corresponds to the required current at +25°C.

Programming the APC Loop

Program the average optical power by adjusting $-R_{APCSET}$. To select the resistance, determine the desired monitor current to be maintained over temperature and lifetime. See the Monitor Diode Current vs. R_{APCSET} graph in the *Typical Operating Characteristics* section, and select the value of R_{APCSET} that corresponds to the required current.

Interfacing with Laser Diodes

To minimize optical output aberrations caused by signal reflections at the electrical interface to the laser diode, a series-damping resistor (R_D) is required (Figure 4). Additionally, the MAX3735/MAX3735A outputs are optimized for a 15Ω load. Therefore, the series combination of R_D and R_L , where R_L represents the laser-diode resistance, should equal 15Ω. Typical values for R_D are 8Ω to 13Ω. For best performance, place a bypass capacitor (0.01μF typ) as close as possible to the anode of the laser diode. An RC shunt network between the laser cathode and ground minimizes optical output aberrations. Starting values for most coaxial lasers are $R_{COMP} = 50\Omega$ in series with $C_{COMP} = 8pF$. Adjust these values experimentally until the optical output waveform is optimized. Refer to Maxim Application Note: HFAN 02.0: *Interfacing Maxim's Laser Drivers to Laser Diodes* for more information.

2.7Gbps, Low-Power SFP Laser Drivers

Table 2. Circuit Responses to Various Single-Point Faults

PIN NAME	CIRCUIT RESPONSE TO OVERVOLTAGE OR SHORT TO V _{CC}	CIRCUIT RESPONSE TO UNDERVOLTAGE OR SHORT TO GROUND
TX_FAULT	Does not affect laser power.	Does not affect laser power.
TX_DISABLE	Modulation and bias currents are disabled.	Normal condition for circuit operation.
IN+	The optical average power increases and a fault occurs if V _{PC_MON} exceeds the threshold. The APC loop responds by decreasing the bias current.	The optical average power decreases and the APC loop responds by increasing the bias current. A fault state occurs if V _{BC_MON} exceeds the threshold voltage.
IN-	The optical average power decreases and the APC loop responds by increasing the bias current. A fault state occurs if V _{BC_MON} exceeds the threshold voltage.	The optical average power increases and a fault occurs if V _{PC_MON} exceeds the threshold. The APC loop responds by decreasing the bias current.
MD	Disables bias current. A fault state occurs.	The APC circuit responds by increasing bias current until a fault is detected, then a fault state* occurs.
SHUTDOWN	Does not affect laser power. If the shutdown circuitry is used, laser current is disabled and a fault state* occurs.	Does not affect laser power.
BIAS	In this condition, laser forward voltage is 0V and no light is emitted.	Fault state* occurs. If the shutdown circuitry is used, the laser current is disabled.
OUT+	The APC circuit responds by increasing the bias current until a fault is detected, then a fault state* occurs.	Fault state* occurs. If the shutdown circuitry is used, laser current is disabled.
OUT-	Does not affect laser power.	Does not affect laser power.
PC_MON	Fault state* occurs.	Does not affect laser power.
BC_MON	Fault state* occurs.	Does not affect laser power.
APCFILT1	IBIAS increases until V _{BC_MON} exceeds the threshold voltage.	IBIAS increases until V _{BC_MON} exceeds the threshold voltage.
APCFILT2	IBIAS increases until V _{BC_MON} exceeds the threshold voltage.	IBIAS increases until V _{BC_MON} exceeds the threshold voltage.
MODSET	Does not affect laser power.	Fault state* occurs.
APCSET	Does not affect laser power.	Fault state* occurs.

*A fault state asserts the TX_FAULT pin, disables the modulation and bias currents, and asserts the SHUTDOWN pin.

Table 3. Optical Power Definitions

PARAMETER	SYMBOL	RELATION
Average Power	P _{AVG}	$P_{AVG} = (P_0 + P_1) / 2$
Extinction Ratio	r _e	$r_e = P_1 / P_0$
Optical Power High	P ₁	$P_1 = 2P_{AVG} \times r_e / (r_e + 1)$
Optical Power Low	P ₀	$P_0 = 2P_{AVG} / (r_e + 1)$
Optical Amplitude	P _{P-P}	$P_{P-P} = P_1 - P_0$
Laser Slope Efficiency	η	$\eta = P_{P-P} / I_{MOD}$
Modulation Current	I _{MOD}	$I_{MOD} = P_{P-P} / \eta$

Pattern-Dependent Jitter

To minimize the pattern-dependent jitter associated with the APC loop time constant, and to guarantee loop stability, connect a capacitor between APCFIL1 and APCFIL2 (see the *Applications Information* section for more information about choosing C_{APC} values). A capacitor attached to the photodiode anode (CMD) is also recommended to filter transient currents that originate from the photodiode. To maintain stability and proper phase margin associated with the two poles created by C_{APC} and CMD, C_{APC} should be 20x greater than CMD for the MAX3735. C_{APC} should be 4x to 20x greater than CMD for the MAX3735A.

2.7Gbps, Low-Power SFP Laser Drivers

Input Termination Requirements

The MAX3735/MAX3735A data inputs are SFP MSA compliant. On-chip 100Ω differential input impedance is provided for optimal termination (Figure 6). Because of the on-chip biasing network, the MAX3735/MAX3735A inputs self-bias to the proper operating point to accommodate AC-coupling.

Optional Shutdown Output Circuitry

The SHUTDOWN control output features extended eye safety when the laser cathode is grounded. An external transistor is required to implement this circuit (Figure 4). In the event of a fault, SHUTDOWN asserts high, placing the optional shutdown transistor in cutoff mode and thereby shutting off the laser current.

Applications Information

An example of how to set up the MAX3735/MAX3735A follows:

Select a communications-grade laser for 2.488Gbps. Assume that the laser output average power is $P_{AVG} = 0\text{dBm}$, the operating temperature is -40°C to $+85^{\circ}\text{C}$, minimum extinction ratio is 6.6 (8.2dB), and the laser diode has the following characteristics:

- Wavelength: $\lambda = 1.3\mu\text{m}$
- Threshold current: $I_{TH} = 22\text{mA}$ at $+25^{\circ}\text{C}$
- Threshold temperature coefficient: $\beta_{TH} = 1.3\% / ^{\circ}\text{C}$
- Laser-to-monitor transfer: $\rho_{MON} = 0.2\text{A/W}$
- Laser slope efficiency: $\eta = 0.05\text{mW/mA}$ at $+25^{\circ}\text{C}$

Determine R_{APCSET}

The desired monitor diode current is estimated by $I_{MD} = P_{AVG} \times \rho_{MON} = 200\mu\text{A}$. The Monitor Diode vs. R_{APCSET} graph in the *Typical Operating Characteristics* section shows that R_{APCSET} should be $3\text{k}\Omega$. The value can also be estimated using the equation below:

$$I_{MD} = 1.23 / (2 \times R_{APCSET})$$

Determine R_{MODSET}

To achieve a minimum extinction ratio (r_e) of 6.6 over temperature and lifetime, calculate the required extinction ratio at $+25^{\circ}\text{C}$. Assuming the results of the calculation are $r_e = 20$ at $+25^{\circ}\text{C}$, the peak-to-peak optical power $P_{P-P} = 1.81\text{mW}$, according to Table 3. The required modulation current is $1.81\text{mW} / (0.05\text{mW/mA}) = 36.2\text{mA}$. The Modulation Current vs. R_{MODSET} graph in the *Typical Operating Characteristics* section shows that R_{MODSET} should be $9.5\text{k}\Omega$. The value can also be estimated using the equation below:

$$I_{MOD} = 1.23 / (0.0037 \times R_{MODSET})$$

Determine C_{APC}

In order to meet SFP timing requirements and minimize pattern-dependent jitter, the C_{APC} capacitor value is determined by the laser-to-monitor transfer and other variables. The following equations and table can be used to choose the C_{APC} values for the MAX3735 and MAX3735A, respectively. The equations and table assume a DC-coupled laser. Refer to Maxim Application Note HFDN 23.0: *Choosing the APC Loop*

Figure 6. Simplified Input Structure

Capacitors Used with MAX3735/MAX3735A SFP Module Designs for more information on choosing C_{APC} for DC- and AC-coupled laser interfaces.

MAX3735

Use the following equation to find the C_{APC} value when using the MAX3735:

$$C_{APC} = 4.04 \times 10^{-9} \times t_{on} \times \eta \times \rho_{MON} (29.3 + 20.6 I_{TH} - 0.22 I_{TH}^2) \times (1947 + 833 I_{MOD} - 7.78 I_{MOD}^2 + 0.103 I_{MOD}^3)$$

where units are:

C_{APC} in μ F, I_{TH} and I_{MOD} in mA and t_{ON} in μ s. C_{MD} can then be chosen as approximately 20x smaller than C_{APC} for the MAX3735.

MAX3735A

Use Table 4 to choose C_{APC} when using the MAX3735A. C_{APC} should be chosen according to the highest gain of the lasers (generally at cold temperature). C_{APC} selection assumes a 34% reduction in the gain of the lasers at +85°C from the cold (-40°C) values.

Table 4. MAX3735A C_{APC} Selection

LASER GAIN (A/A)	C _{APC} (μ F)
0.005	0.039
0.007	0.047
0.010	0.068
0.020	0.100
0.030	0.120
0.040	0.120

where Gain = I_{MD}/(I_{BIAS} - I_{TH} + 0.5 × I_{MOD}) for DC-coupled lasers. C_{MD} can then be chosen as approximately 4x to 20x smaller than C_{APC} for the MAX3735A

Using the MAX3735/MAX3735A with Digital Potentiometers

For more information on using the MAX3735/MAX3735A with the Dallas DS1858/DS1859 SFP controller, refer to Maxim Application Note HFAN 2.3.3: *Optimizing the Resolution of Laser Driver Setting Using Linear Digital Potentiometers* for more information.

Modulation Currents Exceeding 60mA

For applications requiring a modulation current greater than 60mA, headroom is insufficient for proper operation of the laser driver if the laser is DC-coupled. To avoid this problem, the MAX3735/MAX3735A's modulation output can be AC-coupled to the cathode of a laser diode. An external pullup inductor is necessary to DC-bias the modulation output at V_{CC}. Such a configuration

isolates laser forward voltage from the output circuitry and allows the output at OUT+ to swing above and below the supply voltage (V_{CC}). When AC-coupled, the MAX3735/MAX3735A modulation current can be programmed from 10mA to 85mA. Refer to Maxim Application Note HFAN 02.0: *Interfacing Maxim's Laser Drivers to Laser Diodes* for more information on AC-coupling laser drivers to laser diodes.

Interface Models

Figures 6 and 7 show simplified input and output circuits for the MAX3735/MAX3735A laser driver. If dice are used, replace package parasitic elements with bondwire parasitic elements.

Wire Bonding Die

The MAX3735 uses gold metalization with a thickness of 5 μ m (typ). Maxim characterized this circuit with gold wire ball bonding (1-mil diameter wire). Die-pad size is 94 mil (2388 μ m) square, and die thickness is 15 mil (381 μ m). Refer to Maxim Application Note HFAN-08.0.1: *Understanding Bonding Coordinates and Physical Die Size* for additional information.

Layout Considerations

To minimize inductance, keep the connections between the MAX3735 output pins and laser diode as close as possible. Optimize the laser diode performance by placing a bypass capacitor as close as possible to the laser anode. Use good high-frequency layout techniques and multiple-layer boards with uninterrupted ground planes to minimize EMI and crosstalk.

Exposed-Pad Package

The exposed pad on the 24-pin QFN provides a very low thermal resistance path for heat removal from the IC. The pad is also electrical ground on the MAX3735/MAX3735A and must be soldered to the circuit board ground for proper thermal and electrical performance. Refer to Maxim Application Note HFAN-08.1: *Thermal Considerations for QFN and Other Exposed-Pad Packages* for additional information.

Laser Safety and IEC 825

Using the MAX3735/MAX3735A laser driver alone does not ensure that a transmitter design is compliant with IEC 825. The entire transmitter circuit and component selections must be considered. Each user must determine the level of fault tolerance required by the application, recognizing that Maxim products are neither designed nor authorized for use as components in systems intended for surgical implant into the body, for applications intended to support or sustain life, or for any other application in which the failure of a Maxim product could create a situation where personal injury or death may occur.

*Index pad. Orient the die with this pad in the lower-left corner.

**Bond out both pairs of OUT- and OUT+ to minimize series inductance.

Pin Configuration

Chip Information

TRANSISTOR COUNT: 327
 SUBSTRATE CONNECTED TO GND
 DIE SIZE: 60 mils x 79 mils
 PROCESS: SiGe Bipolar

2.7Gbps, Low-Power SFP Laser Drivers

Package Information

(The package drawing(s) in this data sheet may not reflect the most current specifications. For the latest package outline information, go to www.maxim-ic.com/packages.)

MAX3735/MAX3735A

12,16,20, 24L QFN/EPS

NOTES:

- DIE THICKNESS ALLOWABLE IS 0.305mm MAXIMUM (.012 INCHES MAXIMUM).
- DIMENSIONING & TOLERANCES CONFORM MUST TO ASME Y14.5M - 1994.
- N IS THE NUMBER OF TERMINALS.
Nd IS THE NUMBER OF TERMINALS IN X-DIRECTION &
Ne IS THE NUMBER OF TERMINALS IN Y-DIRECTION.
- △** DIMENSION b APPLIES TO PLATED TERMINAL AND IS MEASURED BETWEEN 0.20 AND 0.25mm FROM TERMINAL TIP.
- △** THE PIN #1 IDENTIFIER MUST BE EXISTED ON THE TOP SURFACE OF THE PACKAGE BY USING INDENTATION MARK OR INK/LASER MARKED. DETAILS OF PIN #1 IDENTIFIER IS OPTIONAL, BUT MUST BE LOCATED WITHIN ZONE INDICATED.
- △** EXACT SHAPE AND SIZE OF THIS FEATURE IS OPTIONAL.
- ALL DIMENSIONS ARE IN MILLIMETERS.
- PACKAGE WARPAGE MAX 0.05mm.
- △** APPLIED FOR EXPOSED PAD AND TERMINALS. EXCLUDE EMBEDDING PART OF EXPOSED PAD FROM MEASURING.
- MEETS JEDEC MO220; EXCEPT DIMENSION "b".
- THIS PACKAGE OUTLINE APPLIES TO PUNCHED QFN (STEPPED SIDES).

NOTES:

- DIMENSIONING & TOLERANCING CONFORM TO ASME Y14.5M-1994.
- ALL DIMENSIONS ARE IN MILLIMETERS. ANGLES ARE IN DEGREES.
- N IS THE TOTAL NUMBER OF TERMINALS.
- THE TERMINAL #1 IDENTIFIER AND TERMINAL NUMBERING CONVENTION SHALL CONFORM TO JEDEC 98-1 SFP-012. DETAILS OF TERMINAL #1 IDENTIFIER ARE OPTIONAL, BUT MUST BE LOCATED WITHIN THE ZONE INDICATED. THE TERMINAL #1 IDENTIFIER MAY BE EITHER A MOLD OR MARKED FEATURE.
- DIMENSION b APPLIES TO METALLIZED TERMINAL AND IS MEASURED BETWEEN 0.25 mm AND 0.30 mm FROM TERMINAL TIP.
- ND AND NE REFER TO THE NUMBER OF TERMINALS ON EACH D AND E SIDE RESPECTIVELY.
- DEPOPULATION IS POSSIBLE IN A SYMMETRICAL FASHION.
- COPLANARITY APPLIES TO THE EXPOSED HEAT SINK SLUG AS WELL AS THE TERMINALS.
- DRAWING CONFORMS TO JEDEC M0220.
