

DRAM

MT4LC4M4E8, MT4C4M4E8
MT4LC4M4E9, MT4C4M4E9

FEATURES

- Industry-standard x4 pinout, timing, functions and packages
- State-of-the-art, high-performance, low-power CMOS silicon-gate process
- Single power supply (+3.3V ±0.3V or +5V ±10%)
- All inputs, outputs and clocks are TTL-compatible
- Refresh modes: RAS#-ONLY, HIDDEN and CAS#-BEFORE-RAS# (CBR)
- Optional Self Refresh (S) for low-power data retention
- 11 row, 11 column addresses (2K refresh) or 12 row, 10 column addresses (4K refresh)
- Extended Data-Out (EDO) PAGE MODE access cycle
- 5V-tolerant inputs and I/Os on 3.3V devices

OPTIONS

- Voltages
3.3V LC
5V C
- Refresh Addressing
2,048 (i.e. 2K) Rows E8
4,096 (i.e. 4K) Rows E9
- Packages
Plastic SOJ (300 mil) DJ
Plastic TSOP (300 mil) TG
- Timing
50ns access -5
60ns access -6
- Refresh Rates
Standard Refresh None
Self Refresh (128ms period) S
- Part Number Example: MT4LC4M4E8DJ-6

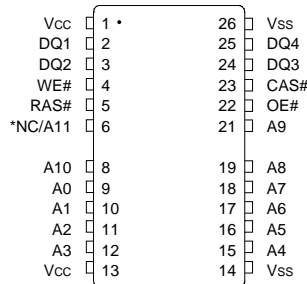

Note: The 4 Meg x 4 EDO DRAM base number differentiates the offerings in two places - MT4LC4M4E8. The third field distinguishes the low voltage offering: LC designates Vcc = 3.3V and C designates Vcc = 5V. The fifth field distinguishes various options: E8 designates a 2K refresh and E9 designates a 4K refresh for EDO DRAMs.

KEY TIMING PARAMETERS

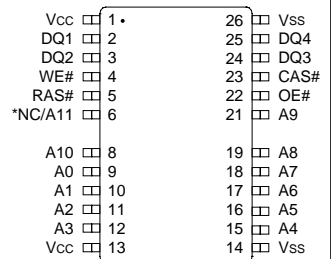

SPEED	t _{RC}	t _{RAC}	t _{PC}	t _{AA}	t _{CAC}	t _{CAS}

GENERAL DESCRIPTION

The 4 Meg x 4 DRAM is a randomly accessed, solid-state memory containing 16,777,216 bits organized in a x4 configuration. RAS# is used to latch the row address (first 11 bits for 2K and first 12 bits for 4K). Once the page has been opened by RAS#, CAS# is used to latch the column address

GENERAL DESCRIPTION (continued)

(the latter 11 bits for 2K and the latter 10 bits for 4K, address pins A10 and A11 are “don’t care”). READ and WRITE cycles are selected with the WE# input.

A logic HIGH on WE# dictates READ mode, while a logic LOW on WE# dictates WRITE mode. During a WRITE cycle, data-in (D) is latched by the falling edge of WE# or CAS#, whichever occurs last. An EARLY WRITE occurs when WE# is taken LOW prior to CAS# falling. A LATE WRITE or READ-MODIFY-WRITE occurs when WE# falls after CAS# is taken LOW. During EARLY WRITE cycles, the data outputs (Q) will remain High-Z regardless of the state of OE#. During LATE WRITE or READ-MODIFY-WRITE cycles, OE# must be taken HIGH to disable the data outputs prior to applying input data. If a LATE WRITE or READ-MODIFY-WRITE is attempted while keeping OE# LOW, no write will occur, and the data outputs will drive read data from the accessed location.

The four data inputs and the four data outputs are routed through four pins using common I/O, and pin direction is controlled by WE# and OE#.

PAGE ACCESS

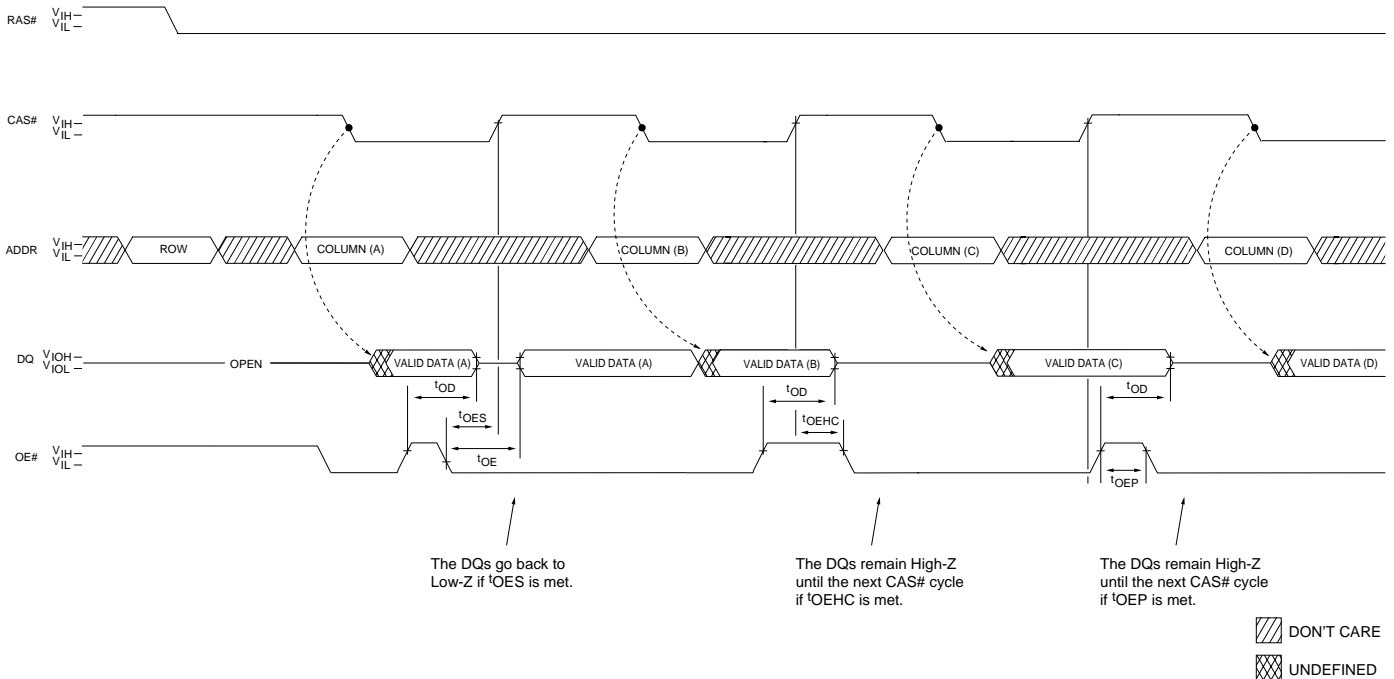

PAGE operations allow faster data operations (READ, WRITE or READ-MODIFY-WRITE) within a row address-defined page boundary. The PAGE cycle is always initiated

with a row address strobed-in by RAS#, followed by a column address strobed-in by CAS#. CAS# may be toggled-in by holding RAS# LOW and strobing-in different column addresses, thus executing faster memory cycles. Returning RAS# HIGH terminates the PAGE MODE of operation, i.e., closes the page.

EDO PAGE MODE

The 4 Meg x 4 EDO DRAM provides EDO PAGE MODE, which is an accelerated FAST PAGE MODE cycle. The primary advantage of EDO is the availability of data-out even after CAS# returns HIGH. EDO allows CAS# precharge time (tCP) to occur without the output data going invalid. This elimination of CAS# output control allows pipeline READs.

FAST PAGE MODE DRAMs have traditionally turned the output buffers off (High-Z) with the rising edge of CAS#. EDO PAGE MODE DRAMs operate like FAST PAGE MODE DRAMs, except data will remain valid or become valid after CAS# goes HIGH during READs, provided RAS# and OE# are held LOW. If OE# is pulsed while RAS# and CAS# are LOW, data will toggle from valid data to High-Z and back to the same valid data. If OE# is toggled or pulsed after CAS# goes HIGH while RAS# remains LOW, data will transition to and remain High-Z (refer to

**Figure 1
OE# CONTROL OF DQs**

Figure 1). WE# can also perform the function of disabling the output devices under certain conditions, as shown in Figure 2.

During an application, if the DQ outputs are wire OR'd, OE# must be used to disable idle banks of DRAMs. Alternatively, pulsing WE# to the idle banks during CAS# high time will also High-Z the outputs. Independent of OE# control, the outputs will disable after t^{OFF}, which is referenced from the rising edge of RAS# or CAS#, whichever occurs last.

REFRESH

Preserve correct memory cell data by maintaining power and executing any RAS# cycle (READ, WRITE) or RAS# refresh cycle (RAS#-ONLY, CBR or HIDDEN) so that all combinations of RAS# addresses (2,048 for 2K and 4,096 for 4K) are executed within t^{REF} (MAX), regardless of sequence. The CBR and Self Refresh cycles will invoke the internal refresh counter for automatic RAS# addressing.

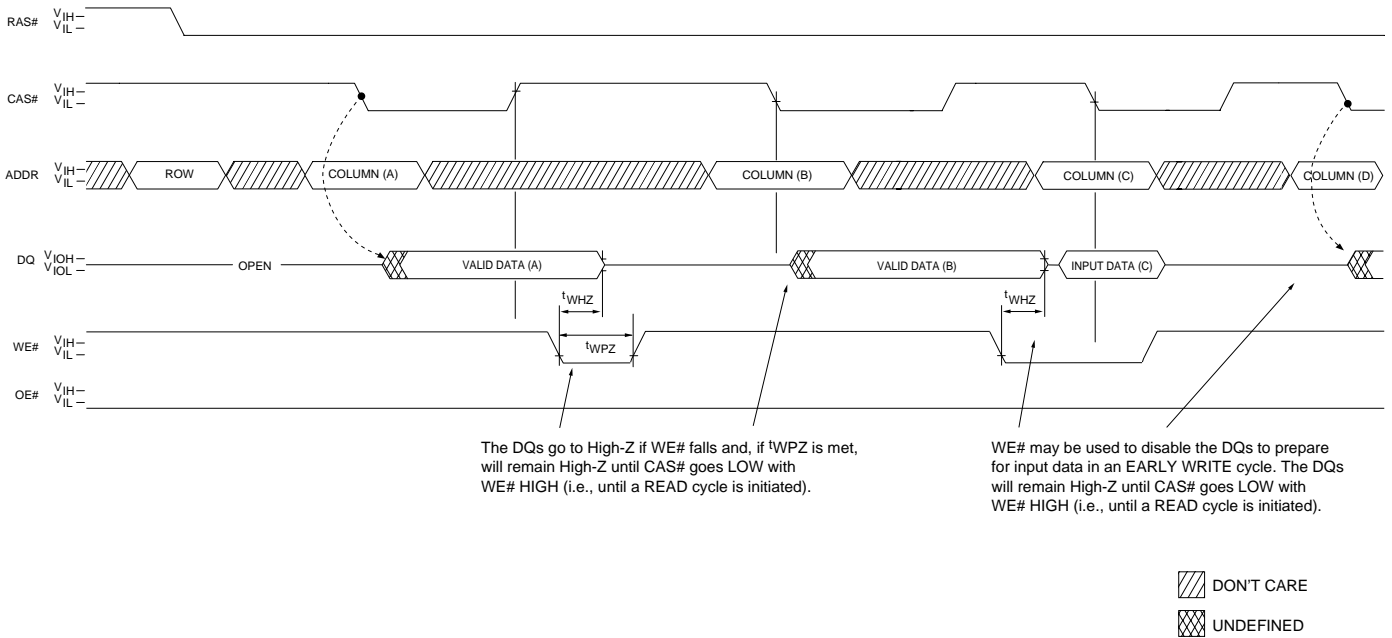

An optional Self Refresh mode is also available on the S version. The "S" option allows the user the choice of a fully static, low-power data retention mode or a dynamic refresh mode at the extended refresh period of 128ms. The optional Self Refresh feature is initiated by performing a CBR Re-

fresh cycle and holding RAS# LOW for the specified t^{RASS}. Additionally, the "S" option allows for an extended refresh period of 128ms, or 31.25µs per row for a 4K refresh and 62.5µs per row for a 2K refresh if using distributed CBR Refresh. This refresh rate can be applied during normal operation, as well as during a standby or BATTERY BACKUP mode.

The Self Refresh mode is terminated by driving RAS# HIGH for a minimum time of t^{RPS}. This delay allows for the completion of any internal refresh cycles that may be in process at the time of the RAS# LOW-to-HIGH transition. If the DRAM controller uses a distributed refresh sequence, a burst refresh is not required upon exiting Self Refresh. However, if the DRAM controller utilizes a RAS#-ONLY or burst refresh sequence, all rows must be refreshed within the average internal refresh rate, prior to the resumption of normal operation.

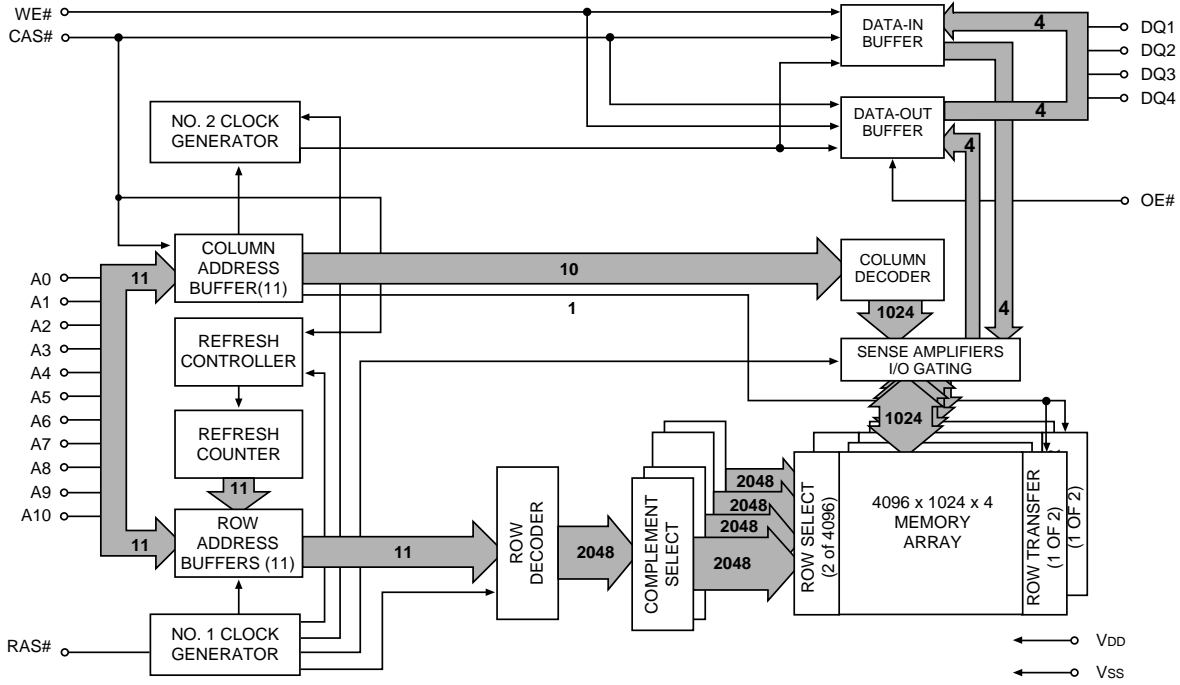

STANDBY

Returning RAS# and CAS# HIGH terminates a memory cycle and decreases chip current to a reduced standby level. The chip is preconditioned for the next cycle during the RAS# HIGH time.

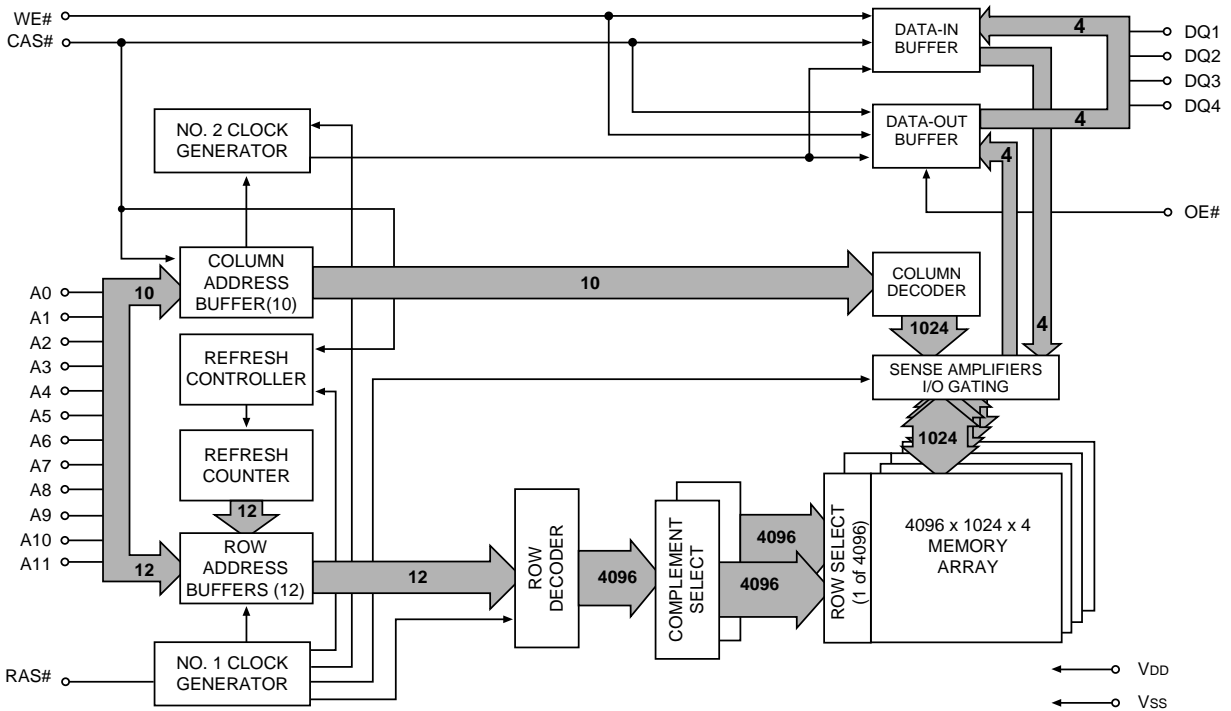

**Figure 2
WE# CONTROL OF DQs**

ABSOLUTE MAXIMUM RATINGS*

Voltage on Vcc Pin Relative to Vss:
 3.3V -1V to +4.6V
 5V -1V to +7V
 Voltage on NC, Inputs or I/O Pins Relative to Vss:
 3.3V -1V to +5.5V
 5V -1V to +7V
 Operating Temperature, T_A (ambient) 0°C to +70°C
 Storage Temperature (plastic) -55°C to +150°C
 Power Dissipation 1W
 Short Circuit Output Current 50mA

*Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

NOTES

1. All voltages referenced to V_{SS}.
2. The minimum specifications are used only to indicate cycle time at which proper operation over the full temperature range (0°C ≤ T_A ≤ 70°C) is ensured.
3. An initial pause of 100μs is required after power-up, followed by eight RAS# refresh cycles (RAS#-ONLY or CBR with WE# HIGH), before proper device operation is ensured. The eight RAS# cycle wake-ups should be repeated any time the t_{REF} refresh requirement is exceeded.
4. NC pins are assumed to be left floating and are not tested for leakage.
5. I_{CC} is dependent on output loading and cycle rates. Specified values are obtained with minimum cycle time and the outputs open.
6. Column address changed once each cycle.
7. Enables on-chip refresh and address counters.
8. This parameter is sampled. V_{CC} = V_{CCMIN}; f = 1 MHz.
9. AC characteristics assume t_T = 2.5ns.
10. V_{IH} (MIN) and V_{IL} (MAX) are reference levels for measuring timing of input signals. Transition times are measured between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}).
11. In addition to meeting the transition rate specification, all input signals must transit between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.
12. Measured with a load equivalent to two TTL gates and 100pF; and V_{OL} = 0.8V and V_{OH} = 2V.
13. t_{WCS}, t_{RWD}, t_{AWD} and t_{CWD} are not restrictive operating parameters. t_{WCS} applies to EARLY WRITE cycles. t_{RWD}, t_{AWD} and t_{CWD} apply to READ-MODIFY-WRITE cycles. If t_{WCS} ≥ t_{WCS} (MIN), the cycle is an EARLY WRITE cycle and the data output will remain an open circuit throughout the entire cycle. If t_{WCS} < t_{WCS} (MIN) and t_{RWD} ≥ t_{RWD} (MIN), t_{AWD} ≥ t_{AWD} (MIN) and t_{CWD} ≥ t_{CWD} (MIN), the cycle is a READ-MODIFY-WRITE and the data output will contain data read from the selected cell. If neither of the above conditions is met, the state of data-out is indeterminate. OE# held HIGH and WE# taken LOW after CAS# goes LOW results in a LATE WRITE (OE#-controlled) cycle. t_{WCS}, t_{RWD}, t_{CWD} and t_{AWD} are not applicable in a LATE WRITE cycle.
14. Requires that t_{AA} and t_{RAC} are not violated.
15. If CAS# is LOW at the falling edge of RAS#, Q will be maintained from the previous cycle. To initiate a new cycle and clear the data-out buffer, CAS# must be pulsed HIGH for t_{CP}.
16. These parameters are referenced to CAS# leading edge in EARLY WRITE cycles and WE# leading edge in LATE WRITE or READ-MODIFY-WRITE cycles.
17. If OE# is tied permanently LOW, LATE WRITE or READ-MODIFY-WRITE operations are not permissible and should not be attempted. Additionally, WE# must be pulsed during CAS# HIGH time in order to place I/O buffers in High-Z.
18. LATE WRITE and READ-MODIFY-WRITE cycles must have both t_{OD} and t_{OE#} met (OE# HIGH during WRITE cycle) in order to ensure that the output buffers will be open during the WRITE cycle. The DQs will provide the previously read data if CAS# remains LOW and OE# is taken back LOW after t_{OE#} is met. If CAS# goes HIGH prior to OE# going back LOW, the DQs will remain open.
19. Requires that t_{AA} and t_{CAC} are not violated.
20. t_{OFF} (MAX) defines the time at which the output achieves the open circuit condition and is not referenced to V_{OH} or V_{OL}. It is referenced from the rising edge of RAS# or CAS#, whichever occurs last.
21. The t_{RAD} (MAX) limit is no longer specified. t_{RAD} (MAX) was specified as a reference point only. If t_{RAD} was greater than the specified t_{RAD} (MAX) limit, then access time was controlled exclusively by t_{AA} (t_{RAC} and t_{CAC} no longer applied). With or without the t_{RAD} (MAX) limit, t_{AA}, t_{RAC} and t_{CAC} must always be met.
22. The t_{RCD} (MAX) limit is no longer specified. t_{RCD} (MAX) was specified as a reference point only. If t_{RCD} was greater than the specified t_{RCD} (MAX) limit, then access time was controlled exclusively by t_{CAC} (t_{RAC} [MIN] no longer applied). With or without the t_{RCD} limit, t_{AA} and t_{CAC} must always be met.
23. Either t_{RCH} or t_{RRH} must be satisfied for a READ cycle.
24. A HIDDEN REFRESH may also be performed after a WRITE cycle. In this case, WE# is LOW and OE# is HIGH.
25. The refresh period is extended from 32ms (2K refresh) or 64ms (4K refresh) to 128ms (both 2K and 4K refreshes). For 4K refresh, t_{RC} = 31.25μs (128ms/4,096 rows = 31.25μs) and for 2K refresh, t_{RC} = 62.5μs (128ms/2,048 rows = 62.5μs).

t _{RP}	30		40		ns
t _{RSH}	13		15		ns

SELF REFRESH CYCLE
(Addresses and OE# = DON'T CARE)

TIMING PARAMETERS

SYMBOL	-5		-6		UNITS
	MIN	MAX	MIN	MAX	
t ^{CHD}	15		15		ns
t ^{CP}	8		10		ns
t ^{CSR}	5		5		ns
t ^{RASS}	100		100		μs
t ^{RP}	30		40		ns

SYMBOL	-5		-6		UNITS
	MIN	MAX	MIN	MAX	
t ^{RPC}	5		5		ns
t ^{RPS}	90		105		ns
t ^{WRH}	8		10		ns
t ^{WRP}	8		10		ns

NOTE: 1. Once t^{RASS} (MIN) is met and RAS# remains LOW, the DRAM will enter Self Refresh mode.
2. Once t^{RPS} is satisfied, a complete burst of all rows should be executed.

24/26-PIN PLASTIC SOJ (300 mil)
DA-2

NOTE: 1. All dimensions in inches (millimeters) $\frac{\text{MAX}}{\text{MIN}}$ or typical where noted.
2. Package width and length do not include mold protrusion; allowable mold protrusion is .01" per side.

**24/26-PIN PLASTIC TSOP (300 mil)
DB-2**

- NOTE:**
1. All dimensions in inches (millimeters) $\frac{\text{MAX}}{\text{MIN}}$ or typical where noted.
 2. Package width and length do not include mold protrusion; allowable mold protrusion is .01" per side.
