

DESCRIPTION

This is a family of 262144-word by 16-bit dynamic RAMS, fabricated with the high performance CMOS process, and is ideal for large-capacity memory systems where high speed, low power dissipation, and low costs are essential.

The use of quadruple-layer polysilicon process combined with silicide technology and a single-transistor dynamic storage stacked capacitor cell provide high circuit density at reduced costs. Multiplexed address inputs permit both a reduction in pins and an increase in system densities.

This device has $\overline{1}CAS$ and $2\overline{W}$ terminals. Refresh cycle is 1024 cycles every 16.4 ms.

FUNCTION

The M5M44170AJ, TP,RT provide, in addition to normal read, write, and read-modify-write operations, a number of other functions, e.g., fast page mode, RAS-only refresh, and delayed-write. The input conditions for each are shown in Table 1.

Table 1 Input condition for each mode

Note 2: Current flowing into an IC is positive. out is negative.

3: Icc1(AV), Icc3(AV) and Icc4(AV) are dependent on cycle rate. Maximum current is measured at the fastest cycle rate.

4: Icc1(AV) and Icc4(AV) are dependent on output loading. Specified values are obtained with the output open.

5: Column Address can be changed once or less while RAS = VIL and CAS = VIH.

Note 6: An initial pause of 500 μs is required after power-up followed by a minimum of eight initialization cycles (any combination of cycles containing a $\overline{\text{RAS}}$ clock such as $\overline{\text{RAS}}$ -Only refresh).

Note the $\overline{\text{RAS}}$ may be cycled during the initial pause. And any 8 $\overline{\text{RAS}}$ or $\overline{\text{RAS}}/\overline{\text{CAS}}$ cycles are required after prolonged periods (greater than 16.4 ms) of $\overline{\text{RAS}}$ inactivity before proper device operation is achieved.

7: Measured with a load circuit equivalent to 2TTL loads and 100pF.

8: Assumes that $t_{\text{RCD}} \geq t_{\text{RCD}}(\text{max})$ and $t_{\text{ASC}} \geq t_{\text{ASC}}(\text{max})$.

9: Assumes that $t_{\text{RCD}} \leq t_{\text{RCD}}(\text{max})$ and $t_{\text{RAD}} \leq t_{\text{RAD}}(\text{max})$. If t_{RCD} or t_{RAD} is greater than the maximum recommended value shown in this table, t_{RAC} will increase by amount that t_{RCD} or t_{RAD} exceeds the value shown.

10: Assumes that $t_{\text{RAD}} \geq t_{\text{RAD}}(\text{max})$ and $t_{\text{ASC}} \leq t_{\text{ASC}}(\text{max})$.

11: Assumes that $t_{\text{CP}} \leq t_{\text{CP}}(\text{max})$ and $t_{\text{ASC}} \geq t_{\text{ASC}}(\text{max})$.

12: $t_{\text{OFF}}(\text{max})$ and $t_{\text{OEZ}}(\text{max})$ defines the time at which the output achieves the high impedance state ($I_{\text{out}} \leq | \pm 10 \mu\text{A} |$) and is not reference to $\text{VOH}(\text{min})$ or $\text{VOL}(\text{max})$.

Note 2 8 Self refresh sequence

MITSUBISHI (MEMORY/ASIC)

Two refreshing ways should be used properly depending on the low pulse width (t_{RASS}) of \overline{RAS} signal during self refresh period.

1. In case of $t_{RASS} < 300$ ms

1.1 Distributed refresh during Read / Write operation

(A) Timing Diagrams

Table 2

Read / Write Cycle	Read / Write → Self Refresh	Self Refresh → Read / Write
CBR distributed refresh	$t_{NSD} + t_{SND} \leq 16.4$ ms	
\overline{RAS} only distributed refresh	$t_{NSD} \leq 16$ μ s	$t_{SND} \leq 16$ μ s

(B) Definition of distributed refresh

Definition of CBR distributed refresh (Including extended refresh)

The CBR distributed refresh performs more than 1024 constant period (125 μ s max) CBR cycles within 128 ms.

Definition of \overline{RAS} only distributed refresh

All combination of nine row address signals (A0 - A9) are selected during 1024 constant period (16 μ s max) \overline{RAS} only refresh cycles within 16.4 ms.

Note : Hidden refresh may be used instead of CBR refresh, $\overline{RAS}/\overline{CAS}$ refresh may be used instead of \overline{RAS} only refresh.

1.1.1. CBR distributed Refresh

● Switching from read / write operation to self refresh operation.

The time interval from the falling edge of \overline{RAS} signal in the last CBR refresh cycle during read / write operation period to the falling edge of \overline{RAS} signal at the start of self refresh operation should be set within t_{NSD} (shown in table 2)

● Switching from self refresh operation to read / write operation.

The time interval from the rising edge of \overline{RAS} signal at the end of self refresh operation to the falling edge of \overline{RAS} signal in the first CBR refresh cycle during read / write operation period should be set within t_{SND} (shown in table 2)

1.1.2. \overline{RAS} only distributed refresh

● Switching from read / write operation to self refresh operation.

The time interval t_{NSD} from the falling edge of \overline{RAS} signal in the last \overline{RAS} only refresh cycle during read / write operation period to the falling edge of \overline{RAS} signal at the start of self refresh operation should be set within 16 μ s.

● Switching from self refresh operation to read / write operation.

The time interval t_{SND} from the rising edge of \overline{RAS} signal at the end of self refresh operation to the falling edge of \overline{RAS} signal in the first CBR refresh cycle during read / write operation period should be set within 16 μ s.

1.2 Burst refresh during Read / Write operation

(A) Timing diagram

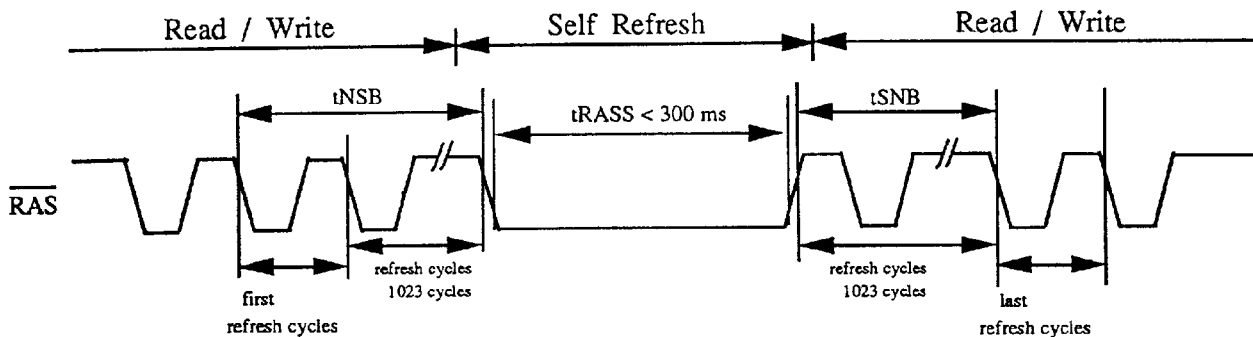

Table 3

Read / Write Cycle	Read / Write \rightarrow Self Refresh	Self Refresh \rightarrow Read / Write
CBR burst refresh	$t_{NSB} \leq 16.4 \text{ ms}$	$t_{SNB} \leq 16.4 \text{ ms}$
$\overline{\text{RAS}}$ only burst refresh	$t_{NSB} + t_{SNB} \leq 16.4 \text{ ms}$	

(B) Definition of burst refresh

Definition of CBR burst refresh

The CBR burst refresh performs more than 1024 continuous CBR cycles within 16.4 ms.

Definition of $\overline{\text{RAS}}$ only burst refresh

All combination of ten row address signals (A0 - A9) are selected during 1024 continuous $\overline{\text{RAS}}$ only refresh cycles within 16.4 ms.

1.2.1 . CBR distributed Refresh

- Switching from read / write operation to self refresh operation.
The time interval t_{NSB} from the falling edge of $\overline{\text{RAS}}$ signal in the first CBR refresh cycle during read / write operation period to the falling edge of $\overline{\text{RAS}}$ signal at the start of self refresh operation should be set within 16.4 ms .
- Switching from self refresh operation to read / write operation.
The time interval t_{SNB} from the rising edge of $\overline{\text{RAS}}$ signal at the end of self refresh operation to the falling edge of $\overline{\text{RAS}}$ signal in the last CBR refresh cycle during read / write operation period should be set within 16.4 ms.

1.2.2 . $\overline{\text{RAS}}$ only distributed refresh

- Switching from read / write operation to self refresh operation.
The time interval from the falling edge of $\overline{\text{RAS}}$ signal in the first $\overline{\text{RAS}}$ only refresh cycle during read / write operation period to the falling edge of $\overline{\text{RAS}}$ signal at the start of self refresh operation should be set within t_{NSB} (shown in table 3)
- Switching from self refresh operation to read / write operation.
The time interval from the rising edge of $\overline{\text{RAS}}$ signal at the end of self refresh operation to the falling edge of $\overline{\text{RAS}}$ signal in the last $\overline{\text{RAS}}$ only refresh cycle during read / write operation period should be set within t_{SNB} (shown in table 3)

(B) Definition of refresh

The same as 1.1 - (B) and 1.2 - (B).

2. 1. 1 CBR distributed refresh

- Switching from read / write operation to self refresh operation .
The time interval t_{NSD} from the falling edge of $\overline{\text{RAS}}$ signal in the last CBR refresh cycle during read / write operation period to the falling edge of $\overline{\text{RAS}}$ signal at the start of self refresh operation should be set within 16.4 ms .
- Switching from self refresh operation to read / write operation .
The time interval t_{SND} from the rising edge of $\overline{\text{RAS}}$ signal at the end of self refresh operation to the falling edge of $\overline{\text{RAS}}$ signal in the first CBR refresh cycle during read / write operation period should be set within 16.4 ms .

2. 1. 2 $\overline{\text{RAS}}$ only distributed , CBR burst , $\overline{\text{RAS}}$ only burst refresh

- Before and after the self refresh , 1024 refresh cycles should be executed within 16.4 ms for each refresh operation .
