

## 340MHz Single-Supply Triple Video Buffer

- Bandwidth: 340MHz
- 5V single-supply operation
- Low output rail guaranteed at 60mV max.
- Internal gain of 6dB for a matching between 3 channels
- Very low harmonic distortion
- Slew rate: 740V/μs
- Specified for 150Ω and 100Ω loads
- Tested on 5V power supply
- Data min. and max. are tested during production

### Description

The TSH344 is a triple single-supply video buffer featuring an internal gain of 6dB and a large bandwidth of 340MHz.

The main advantage of this buffer is its very low output rail very close to GND when supplied in single supply 0/5V. This output rail is guaranteed by test at 60mV from GND on 150Ω. *Chapter 4* of this datasheet gives technical support when using the TSH344 as RGB driver for video DAC output on a video line (see TSH343 for Y-Pb-Pr signals).

The TSH344 is available in the compact SO8 plastic package for optimum space-saving.

### Pin Connections (top view)

### Applications

- High-end video systems
- High Definition TV (HDTV)
- Broadcast and graphic video
- Multimedia products

### Order Codes

Part Number	Temperature Range	Package	Packing	Marking
TSH344ID	-40°C to +85°C	SO-8	Tube	TSH344I
TSH344IDT			Tape & Reel	TSH344I

# 1 Absolute Maximum Ratings

**Table 1. Key parameters and their absolute maximum ratings**

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage <sup>(1)</sup>	6	V
$V_{in}$	Input Voltage Range <sup>(2)</sup>	0 to +2	V
$T_{oper}$	Operating Free Air Temperature Range	-40 to +85	°C
$T_{std}$	Storage Temperature	-65 to +150	°C
$T_j$	Maximum Junction Temperature	150	°C
$R_{thjc}$	SO8 Thermal Resistance Junction to Case	28	°C/W
$R_{thja}$	SO8 Thermal Resistance Junction to Ambient Area	157	°C/W
$P_{max.}$	Maximum Power Dissipation (@ $T_a=25^{\circ}C$ ) for $T_j=150^{\circ}C$	800	mW
ESD	CDM: Charged Device Model	2	kV
	HBM: Human Body Model	1.5	kV
	MM: Machine Model	200	V

1. All voltage values, except differential voltage, are with respect to network terminal.
2. The magnitude of input and output voltage must never exceed  $V_{CC} + 0.3V$ .

**Table 2. Operating conditions**

Symbol	Parameter	Value	Unit
$V_{CC}$	Power Supply Voltage <sup>(1)</sup>	3 to 5.5	V

1. Tested in full production at 0V/5V single power supply

## 2 Electrical Characteristics

**Table 3.  $V_{CC} = +5V$  Single Supply,  $T_{amb} = 25^{\circ}C$  (unless otherwise specified)**

Symbol	Parameter	Test Condition	Min.	Typ.	Max.	Unit
<b>DC Performance</b>						
$V_{OS}$	Output Offset Voltage <sup>(1)</sup>	no Load, $T_{amb}$	-35	-8	+35	mV
		$-40^{\circ}C < T_{amb} < +85^{\circ}C$		-8.6		
$I_{ib}$	Input Bias Current	$T_{amb}$ , input to GND		5.5	16	$\mu A$
		$-40^{\circ}C < T_{amb} < +85^{\circ}C$		6

### 3 Power Supply Considerations and improvement of the PSRR

Correct power supply bypassing is very important for optimizing performance in low and high-frequency ranges. Bypass capacitors should be placed as close as possible to the IC pin (pin 4) to improve high-frequency bypassing. A capacitor ( $C_{LF}$ ) greater than 100uF is necessary to improve the PSRR in low frequencies. For better quality bypassing, a capacitor of 470nF ( $C_{HF}$ ) is added using the same implementation conditions to improve the PSRR in the higher frequencies.

**Figure 25. Circuit for power supply bypassing**

The following graph in *Figure 26* shows the evolution of the PSRR against the frequency when the power supply decoupling is achieved carefully or not.

**Figure 26. PSRR improvement**

## 4 Using the TSH344 to Drive RGB Video Components

Figure 27. Shapes of video signals coming from DACs

Figure 28. Implementation of the video driver on output video DACs

Figure 28 shows a schematic diagram of the use of the TSH344 to drive video output from DACs.

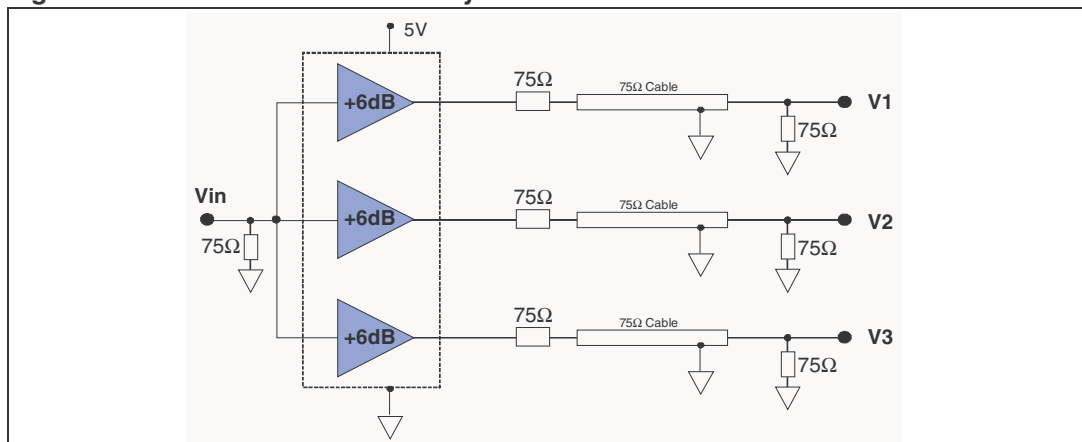

The TSH344 is used to drive high definition video signals up to 30MHz on 75-ohm video lines. It is dedicated to driving RGB signals typically between 300mV and 1V, as seen in (1).

With a very low output rail ( $V_{OL}$ ) guaranteed in test of production at 60mV maximum, it is possible to drive the signal in single supply without any saturation of the driver against the lower rail.

Assuming that we lose half of the signal by output impedance-matching in order to properly drive the video line, the shifted signal is multiplied by a gain of 2 or +6dB (3).

## 4.1 Delay between channels

Figure 29. Measurement of the delay between each channel

Delay between each video component is an important aspect in high definition video systems. To drive properly the three video components without any relative delay, the dice of the TSH344 is layouted out with a very symmetrical geometry. The effect is direct on the synchronization of each channel, as shown in Figure 30. No delay appears between each channel when the same  $V_{in}$  signal is applied on the three inputs. Note that the delay from the inputs the outputs equals 4ns.

Figure 30. Relative delay between each channel
