(Read Operation, Continued)

Notes:

- *1: The output load is 30 pF
- *2: The output load is 5 pF.
- *3: The t_{CE} is applicable if \overline{OE} is brought to Low before $\overline{CE1}$ goes Low and is also applicable if actual value of both or either t_{ASO} or t_{CLOL} is shorter than specified value.
- *4: Applicable if \overline{OE} is brought to Low before $\overline{CE1}$ goes Low.
- *5: The t_{ASO} , $t_{CLOL}(\text{min.})$ and $t_{OP}(\text{min.})$ are reference values when the access time is determined by t_{OE} . If actual value of each parameter is shorter than specified minimum value, t_{OE} become longer by the amount of subtracting actual value from specified minimum value.

For example, if actual t_{ASO} , $t_{ASO}(\text{actual})$, is shorter than specified minimum value, $t_{ASO}(\text{min.})$, during \overline{OE} control access (ie., $\overline{CE1}$ stays Low), the t_{OE} become $t_{OE}(\text{max.}) + t_{ASO}(\text{min.}) - t_{ASO}(\text{actual})$.
- *6: The $t_{ASO}(\text{ABS})$ and $t_{OP}(\text{ABS})$ is the absolute minimum value during \overline{OE} control access.
- *7: If actual value of either t_{CLOL} or t_{OP} is shorter than specified minimum value, both t_{OLAH} and t_{OLCH} become $t_{RC}(\text{min.}) - t_{CLOL}(\text{actual})$ or $t_{RC}(\text{min.}) - t_{OP}(\text{actual})$.
- *8: Maximum value is applicable if $\overline{CE1}$ is kept at low.

Write Operation, Continued

Notes:

- *1: Minimum value must be equal or greater than the sum of actual t_{CW} (or t_{WP}) and t_{WRC} (or t_{WR}).
- *2: New write address is valid from either $\overline{CE1}$ or \overline{WE} is brought to High.
- *3: The t_{OE} is specified from end of $t_{WC}(\text{min.})$. The $t_{OE}(\text{min.})$ is a reference value when the access time is determined by t_{OE} .
If actual value, $t_{OE}(\text{actual})$ is shorter than specified minimum value, t_{OE} become longer by the amount of subtracting actual value from specified minimum value.
- *4: The $t_{OE}(\text{max.})$ is applicable if $\overline{CE1}$ is kept at Low and both \overline{WE} and \overline{OE} are kept at High.
- *5: The $t_{OE}[\text{ABS}]$ is the absolute minimum value if write cycle is terminated by \overline{WE} and $\overline{CE1}$ stays Low.
- *6: $t_{OHCL}(\text{min.})$ must be satisfied if read operation is not performed prior to write operation.
In case \overline{OE} is disabled after $t_{OHCL}(\text{min.})$, \overline{WE} Low must be asserted after $t_{RC}(\text{min.})$ from $\overline{CE1}$ Low. In other words, read operation is initiated if $t_{OHCL}(\text{min.})$ is not satisfied.
- *7: Applicable if $\overline{CE1}$ stays Low after read operation.
- *8: t_{CW} and t_{WP} is applicable if write operation is initiated by $\overline{CE1}$ and \overline{WE} , respectively.
- *9: t_{WRC} and t_{WR} is applicable if write operation is terminated by $\overline{CE1}$ and \overline{WE} , respectively.
The $t_{WR}(\text{min.})$ can be ignored if $\overline{CE1}$ is brought to High together or after \overline{WE} is brought to High. In such case, the $t_{CP}(\text{min.})$ must be satisfied.
